unchilled embryos mainly produced abnormal plants. The role of IAA in the release from dormancy and plant regeneration has been discussed by FAURE et al. (1998). These authors suggested that grape somatic embryos do not accumulate ABA and/or IAA in sufficient concentrations to support normal plantlet development. Thus, the addition of IAA to the embryo germination medium could explain, in Plant regeneration via somatic embryogenesis in cotton L. Embryogenic callus and somatic embryos have been obtained directly from the explants of cotton abnormal seedlings. Plant growth regulators influenced the induction of cotton somatic embryogenesis.
