#### **DNA Assembly and Cloning | NEB**

For the purposes of cloning, DNA assembly refers to a method to physically link together multiple fragments of DNA, in an end-to-end fashion, to achieve a desired, higher-order assembly prior to joining to a vector. This process is the cornerstone of the synthetic biology movement, and allows the construction of novel biological systems and devices using defined components. The methods are

#### **Addgene: Choosing a Molecular Cloning Technique**

Restriction enzyme (endonuclease) based molecular cloning is the "classic" cloning method, and for many reasons, remains one of the most popular today. In a restriction digest, enzymes are utilized to cut double stranded DNA into fragments containing precise 5' or 3' single-strand overhangs (sticky ends), or no overhang (blunt ends).

#### **Hot Fusion: An Efficient Method to Clone Multiple DNA ...**

Molecular cloning is utilized in nearly every facet of biological and medical research. We have developed a method, termed Hot Fusion, to efficiently clone one or multiple DNA fragments into plasmid vectors without the use of ligase. The method is directional, produces seamless junctions and is not dependent on the availability of restriction
