The pressures within the areas where compressive forces are transmitted from the structure to the ice fluctuate considerably both in space and in time, with most of the force concentrated intensely in regions termed high-pressure zones.

When ice melts, the structure breaks down and the molecules tend to fill up this wasted space. This means that the water formed takes up less space than the original ice. Ice is a very unusual solid in this respect - most solids show an increase in volume on melting.

The basic structure of ice Ih consists of a hexameric box and the unit cell is considered as a group of four water molecules. Each hexameric box in the ice structure contains two full and two half unit cells. The dimensions chosen for the contour plots in this work cover approximately one full hexameric box ensuring that every position an ion might occupy within the ice lattice is investigated.

of the ice lattice. In the crystal structure, a dimer is formed along the surfaces of parallel b-sheets. The two monomers do not interact directly with each other; instead, two ranks of seven water molecules mediate the interaction. In light of the bound coplanar external water molecules and the spacing between OH groups of the Thr residues (Fig. 1), it was predicted that in one monomer the

Ice - Wikipedia

Ice also plays a central role in winter recreation and in many sports such as ice skating, four skating, ice hockey, bandy, ice fishing, ice climbing, curling, broomball and sled racing on bobsled, luge and skeleton.

Aromatic-aromatic interactions in structures of proteins ...

Interactions between the aromatic amino acid residues have a significant influence on the protein structures and protein-DNA complexes. These interactions individually provide little stability to the structure; however, together they contribute significantly to the conformational stability of the protein structure.

Hi Contact pairs are for object that might interact intermittently, that might not be in contact all the time, in FSI you mostly have the liquide always in contact with the structure (except for waves perhaps) even if the liquid flows.
