The thesis titled Material Cycling of Wetland Soils Driven by Freeze-Thaw Effects systematically explores the freeze-thaw effects on the accumulation and release processes of carbon and nitrogen in wetland soils, which is a good step toward the investigation of biogeochemical processes in wetlands in seasonal freeze-thaw areas. It is also developing strategies aimed at global warming effects on the accumulation and release of carbon and nitrogen in wetlands.

The freeze thaw process is an important characteristic of climate change in seasonal freeze thaw wetlands, which affects the biogeochemical processes of wetland ecosystems in many ways. As a type of abiotic stress, freeze thaw can change the soil aggregates, permeability and mechanical properties. The freeze thaw process also indirectly affects nutrient circulation, through its impact
