Early transcriptional profiling data evidenced that microRNA expression profiling may successfully classify different tumour types and do so more reliably than mRNA profiling, suggesting that the miRNA repertoire is a stable and unique feature of different cell types and differentiation stages (Lu et al.,

[MicroRNAs in cancer: biomarkers, functions and therapy](#)

Due to the fact that microRNA expression patterns are altered in cancer compared to normal tissue, and also altered between subtypes, they are likely to be future biomarkers for the stratification and prediction of prognosis for cancer patients.

[MicroRNA and cancer A brief overview - ScienceDirect](#)

MicroRNA (miRNA) genes are evolutionally conserved. Their location is either within the introns or exons of protein-coding genes (about the 70%) or in the intergenic areas (30%).

[MicroRNAs in cancer: biomarkers, functions and therapy ...](#)

Clinical trials utilizing microRNA profiling for patient prognosis and clinical response are now underway, and the first microRNA mimic entered the clinic for cancer therapy in 2013. In this article we review the potential applications of microRNAs for the clinical assessment of patient outcome in cancer, as well as in cancer monitoring and therapy.

The challenges for microRNA-based are the same as the challenges for small interfering RNA therapeutics and include issues of delivery, potential off-target effects and safety. One of the major obstacles for the use of miRNA therapeutics is the tissue-specific delivery [51 , 52].

MicroRNA implications for cancer

MicroRNA expression has been found to be deregulated in a wide range of human diseases including cancer. However, it remains uncertain whether altered miRNA expression is a cause or consequence of pathological processes. The underlying mechanisms of why and how miRNAs become deregulated are largely unknown. Although bioinformatics approaches can predict thousands of genes that are potentially

Papillary Urothelial Carcinoma: Treatment, Prognosis, and More

Papillary urothelial carcinoma is a type of bladder cancer. It starts in urothelial cells in the bladder lining. Urothelial cells also line the urethra, ureters, and other parts of the urinary tract.

MicroRNAs (miRNAs) are short non-coding RNAs with a length of 22 nucleotides, involved in post-transcriptional regulation of gene expression.

microRNA - What it is and How it Works | OSUCCC - James

A mutation in a microRNA gene can leave the cell without that particular microRNA or reduce it a low level in the cell. Abnormally low levels of a microRNA can lead to overexpression of genes that that microRNA regulates, and that can lead to cancer development and progression.

microRNA - Wikipedia

A microRNA (abbreviated miRNA) is a small non-coding RNA molecule (containing about 22 nucleotides) found in plants, animals and some viruses, that functions in RNA silencing and post-transcriptional regulation of gene expression.
