DNA-protein and RNA-protein interactions can have a profound effect on gene expression and the spatial and temporal localisation of mRNA within a cell. DNA-protein interactions include those between DNA and transcription factors or other regulatory proteins. RNA-protein interactions include those between RNA and the ribosome, and other RNA-binding proteins (20,21).

Protein RNA interactions: a structural analysis

A detailed computational analysis of 32 protein RNA complexes is presented. A number of physical and chemical properties of the intermolecular interfaces are calculated and compared with those observed in protein double-stranded DNA and protein single-stranded DNA complexes.

RNA-binding protein - Wikipedia

RNA-binding proteins' transcriptional and post-transcriptional regulation of RNA has a role in regulating the patterns of gene expression during development. Extensive research on the nematode *C. elegans* has identified RNA-binding proteins as essential factors during germline and early embryonic development.

Protein-RNA interaction analysis bioinformatics tools - omicX

Interactions between proteins and RNA play essential roles for life. For example, protein-RNA interactions mediate RNA metabolic processes such as splicing, polyadenylation, messenger RNA stability, localization and translation. Furthermore, many of these RNA-binding proteins are involved in human diseases.

RNA-protein interaction, and related novel techniques and strategies. The two editions are not redundant but complement each other. Chapter 1 describes the affinity purification of proteins that bind to specific RNA that is tagged with biotin and bound to streptavidin beads. Chapter 2 describes the affinity purification of an entire RNP using 2'-O-methyl anti-sense RNA followed by elution.
