Rockwell Hardness Testing

Hardness is a characteristic of a material, not a fundamental physical property. It is defined as the resistance to indentation, and it is determined by measuring the permanent depth of the indentation. [Rockwell Hardness Testing | Rockwell Hardness Failure ...](#)

Rockwell hardness testing is a general method for measuring the bulk hardness of metallic and polymer materials. Although hardness testing does not give a direct measurement of any performance properties, hardness of a material correlates directly with its strength, wear resistance, and other properties.

Rockwell test procedure Hardness Know-How

In the Rockwell hardness test, a differential-depth method, the residual depth of the indent made by the indenter is measured. In contrast, the indentation size is measured in the Brinell, Vickers and Knoop optical test methods.

The Rockwell Hardness Test is generally a non-destructive test performed on samples when it is necessary to determine how hard a material is. Hugh M. Rockwell (1890-1957) and Stanley P. Rockwell (1886-1940) from Connecticut co-invented the first tester and a patent was granted in 1919.

Rockwell testing is similar to Brinell's method with many variations such as the shape of the penetrating device and methods which they are applied. Rockwell actually applies a minor load and a major load then derives a hardness number on either a "B" or "C" scale depending on the variables used creating the impression.
