Steroid hormone receptor - Wikipedia

Steroid hormone receptor. Steroid hormone receptors are found in the nucleus, cytosol, and also on the plasma membrane of target cells. They are generally intracellular receptors (typically cytoplasmic or nuclear) and initiate signal transduction for steroid hormones which lead to changes in gene expression over a time period of hours to days.

Steroid Receptor - an overview | ScienceDirect Topics

The sex steroid receptors ER, PR, and AR are differentially expressed in distinct areas throughout the forebrain and brain stem. 137-139 Because gonadal steroids perform many functions within the CNS, it is likely that only a small subset of the cells in the brain that express gonadal steroid receptors are directly involved in the regulation of gonadotropin secretion.

Steroid Hormone Receptor - an overview | ScienceDirect Topics

Steroid Hormone Receptor. Steroid receptors (SRs) are a subfamily of the nuclear receptor superfamily, containing five classical members: estrogen receptors (ESRs), progesterone receptors (PGRs), androgen receptors (ARs), glucocorticoid receptors (GRs), and mineralocorticoid receptor (MR) (Williams-Ashman and Reddi, 1971; Toft and Gorski, 1966; Kuiper et al., 1996; Bruchovsky and Wilson, 1968; Munck and Brinck-Johnsen, 1968; Porter and Edelman, 1964).
