[Beta-2 adrenergic receptor - Wikipedia](#)

The beta-2 adrenergic receptor (β_2 adrenoreceptor), also known as ADRB2, is a cell membrane-spanning beta-adrenergic receptor that interacts with epinephrine, a hormone and neurotransmitter (ligand synonym).

[Adrenergic receptor - Wikipedia](#)

The adrenergic receptors or adrenoreceptors are a class of G protein-coupled receptors that are targets of many catecholamines like norepinephrine (noradrenaline) and epinephrine (adrenaline) produced by the body, but also many medications like beta blockers, β_2 agonists and β_1 agonists, which are used to treat high blood pressure and asthma.

Beta-adrenergic blocking agents are a class of medicines that bind to beta-adrenoreceptors and prevent the binding of norepinephrine and epinephrine at these receptors.

[Beta adrenergic receptors | CME at Pharmacology Corner](#)

Beta receptors are a subtype of adrenergic receptor (adrenoreceptor), their activation triggers a sympathomimetic (adrenergic) response. This article overviews the characteristics related to their physiology and pharmacological aspects.

[Physiology of Adrenergic Receptors](#)

Adrenergic receptors respond to sympathetic stimulation and blood-borne epinephrine. Receptors are located on smooth muscle, cardiac pacemaker, myocardium and glands. Stimulatory subtypes are alpha 1 and beta 1; inhibitory subtypes are alpha 2, beta 2 & 3.

The adrenergic receptors are divided into two types: alpha and beta. Alpha Receptors The alpha receptors, or alpha-adrenoreceptors, are those that respond to epinephrine and norepinephrine.

Beta-adrenergic agonist - Wikipedia

Beta adrenergic agonists or beta agonists are medications that relax muscles of the airways, which widen the airways and result in easier breathing. They are a class of sympathomimetic agents which act upon the beta adrenoceptors. In general, pure beta-adrenergic agonists have the opposite function of beta blockers.
