Trinucleotide repeat expansion disorders, Triplet repeat expansion disorders or Codon reiteration disorders

Trinucleotide repeat disorders are a set of genetic disorders caused by trinucleotide repeat expansion , a kind of mutation where trinucleotide repeats in certain genes or introns [1] exceed the normal, stable threshold, which differs per gene.

Trinucleotide Repeat Expansion - an overview ...

Trinucleotide Repeat Expansion. Trinucleotide repeats are either found in coding region resulting in the production of a protein with altered function (i.e. Huntington disease), or in non-coding regions resulting in an altered transcription and loss of protein synthesis (Fragile X syndrome, Friedreich's ataxia, myotonic dystrophy) [181].

Unstable trinucleotide repeats in different diseases

Disorders due to expansion of trinucleotide repeats can be distinguished according to the type of trinucleotide repeat,i.e., the sequence of the three nucleotides, their location with respect to the gene involved, and their clinical features.

A Brief History of Triplet Repeat Diseases

I Introduction. The unstable and dynamic transmission of simple repetitive elements in DNA is a new type of mutation, which has changed the face of genetics . The mutation, referred to as trinucleotide repeat (TNR) expansion, occurs when the number of triplets present in a mutated gene is greater than the number found in a normal gene [1-3]
